

Git & GitHub

Quick introduction

Fulvio Corno Giuseppe Averta Carlo Masone Francesca Pistilli

Tecniche di Programmazione - 2023/2024

Goal

- What is Revision Control?
- What is Git?
- What is GitHub?
- How to access Revision Control with Git and GitHub from within Eclipse?
- What are the Eclipse workflows useful in this course?

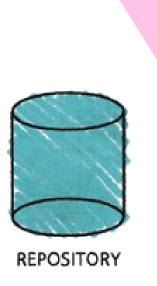

Version Control Systems

Record changes to a file or a set of files over time so that you can recall specific versions later

- Three generations:
 - Local (RCS, SCCS)
 - Centralized (CVS, Subversion, Team Foundation Server)
 - Distributed (Git, Mercurial)

NOW

- Repository
 - place where you store all your work
 - contains every version of your work that has ever existed
 - files
 - directories layout
 - history
 - can be shared with the whole team

Working copy

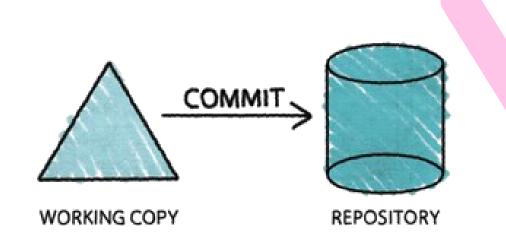

- a snapshot of the repository used for... working
- the place where changes happens
- private, not shared with the team
- it also contains some metadata so that it can keep track of the state of things
 - has a file been modified?
 - is this file new?
 - has a file been deleted?

WORKING COPY

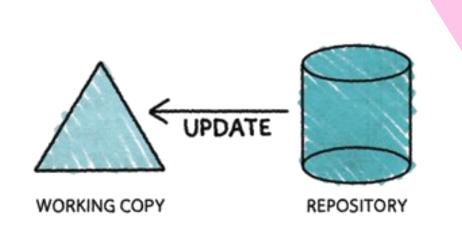

Commit

- the operation that modifies the repository
- atomically performed by modern version control tools
 - the integrity of the repository is ensured
- it is typical to provide a log message (or comment) when you commit
 - to explain the changes you have made
 - the message becomes part of the history of the repository

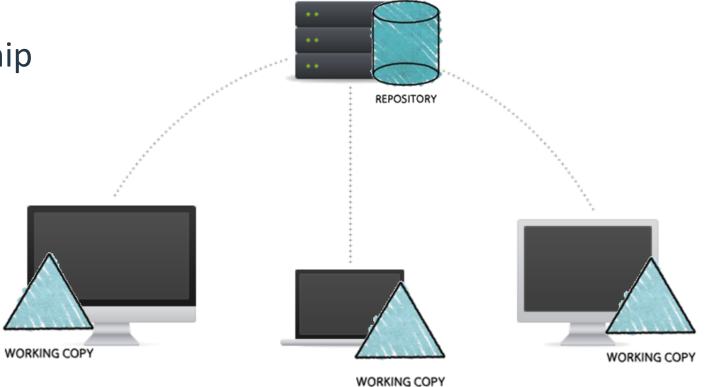

Update

- update the working copy with respect to the repository
 - apply changes from the repository
 - merge such changes with the ones you have made to your working copy, if necessary

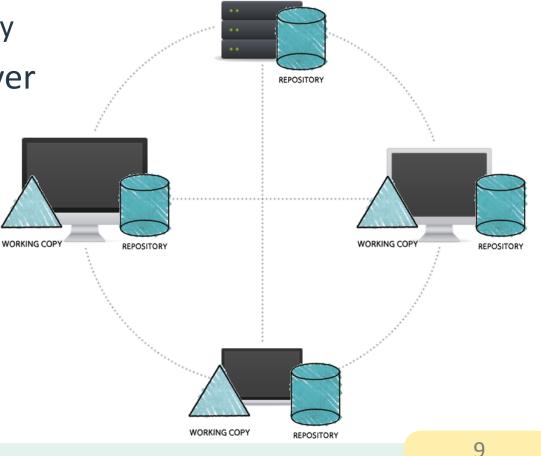

Centralized Version Control

- one central repository
- client-server relationship

Distributed Version Control

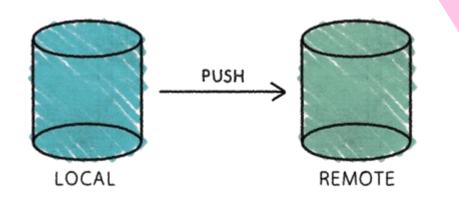

- clients and server have the full copy of the repository
 - local repositories 'clone' a remote repository
- it is possible to have more than one server

More Basic Concepts

Push

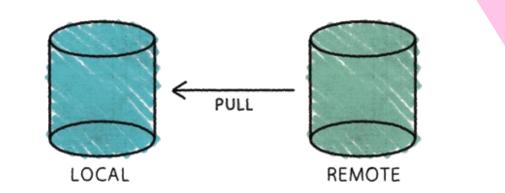

- copy changesets from a local repository instance to a remote one
 - synchronization between two repository instances

More Basic Concepts

Pull

- copy changesets from a remote repository instance to a local one
 - synchronization between two repository instances

Introducing... Git

- Distributed Version Control System
- Born
 - on 2005 for the Linux kernel project
 - to be used via command line
- Website: <u>http://git-scm.com</u>
- Highlights:
 - free and open source
 - strong support for non-linear development
 - fully distributed
 - efficient handling of large projects
 - cryptographic authentication of history

Getting started with Git

- Standard installations
 - <u>http://git-scm.com/downloads</u>
- Available for all the platform
- Git Graphical Applications
 - <u>http://git-scm.com/downloads/guis</u>
 - Suggestion: GitExtensions, SourceTree, Fork
- For this course, Git is
 - integrated in PyCharm

Hosted Git

- To have (at least) one remote repository
 - alternative: set up your own Git server!
- Most popular:
 - GitHub, <u>https://github.com/</u>
 - Bitbucket, <u>https://bitbucket.org/</u>
 - GitLab, <u>https://about.gitlab.com/gitlab-com/</u>

count to nos

- free plans for students
 - <u>https://education.github.com</u>

15

- Slightly different than other code-hosting sites
 - instead of being primarily based on the project, it is user-centric
 - social coding

GitHub

- Owned by Microsoft
 - free account to host as many open source project as you want

For Labs

- Create a personal GitHub account
 - You will have "education" discounts if you use your University e-mail
 - <u>https://education.github.com</u>
- Try Git!
 - <u>http://try.github.io/</u>
 - 15 minutes tutorial

Quick introduction to Git & GitHub

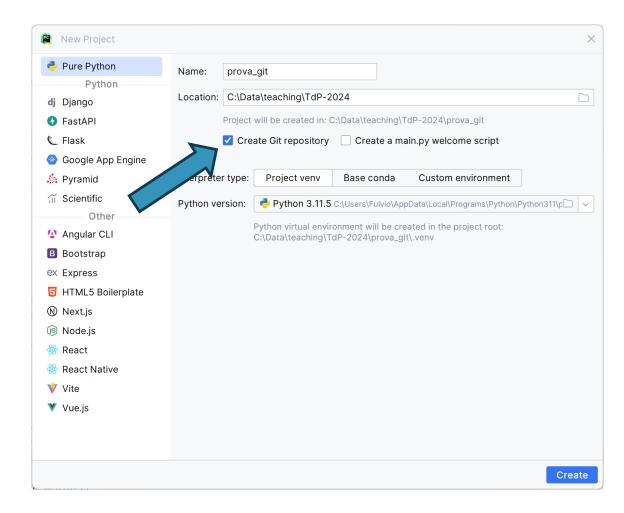

GITHUB-BASED WORKFLOWS

Workflow 1: "Create new project"

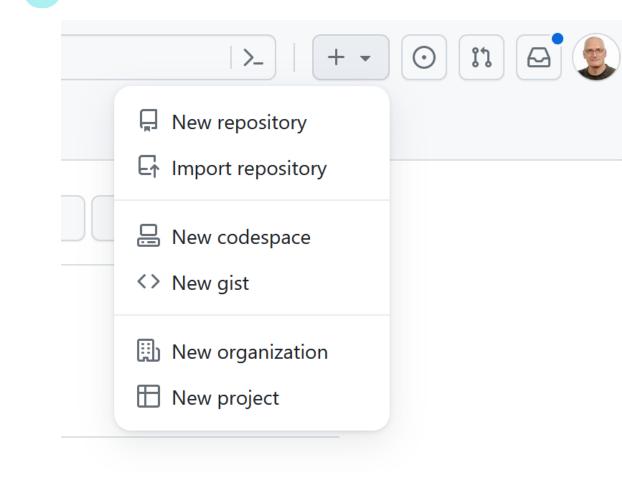

- 1. Create a project in PyCharm
 - 1. File/New Project...
 - 2. Select "Create Git Repository"
- 2. Create and edit Python files
- 3. Create a new (empty) project in GitHub
 - 1. Copy the Project URL
- 4. Push changes (Commit&push)
 - 1. The first time, you must Define Remote

Create new project in PyCharm

Create Repository in GitHub

Create a new repository

A repository contains all project files, including the revision history. Already have a project repository elsewhere? Import a repository,

Required fields are marked with an asterisk (*).

Repository template

No template 🔻

Start your repository with a template repository's contents.

Owner *

Repository name *

Choose an owner 👻 🖊 prova_git

Great repository names are short and memorable. Need inspiration? How about effective-tribble ?

Description (optional)

(i) Please choose an owner to see the available visibility options.

Initialize this repository with:

Add a README file This is where you can write a long description for your project. <u>Learn more about READMEs.</u>

Add .gitignore

.gitignore template: None 💌

Choose which files not to track from a list of templates. Learn more about ignoring files.

Choose a license

License: None 💌

A license tells others what they can and can't do with your code. Learn more about licenses.

Create repository

🔘 © 2024 GitHub, Inc. Terms Privacy Security Status Docs Contact Manage cookies Do not share my personal information

Copy the Repository URL

Set up in Desktop or

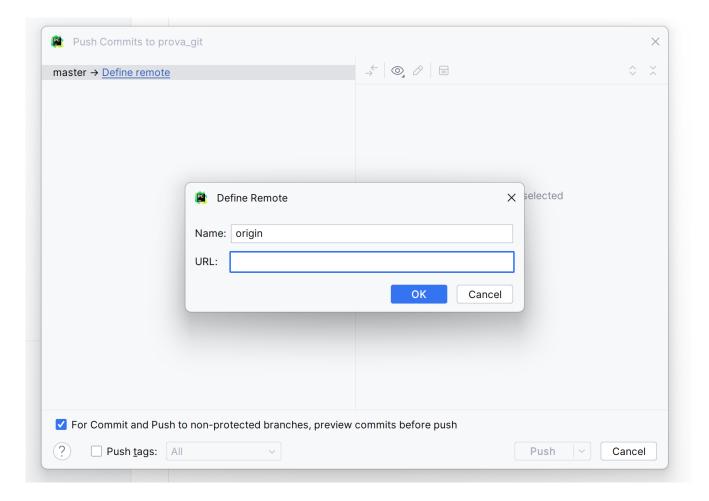

or HTTPS SSH https://gi

https://github.com/fulcorno/prova_git.git

Get started by creating a new file or uploading an existing file. We recommend every repository include a README, LICENSE, and gitignore.

D

Defining remote to push

Tecniche di Programmazione - 2023/2024

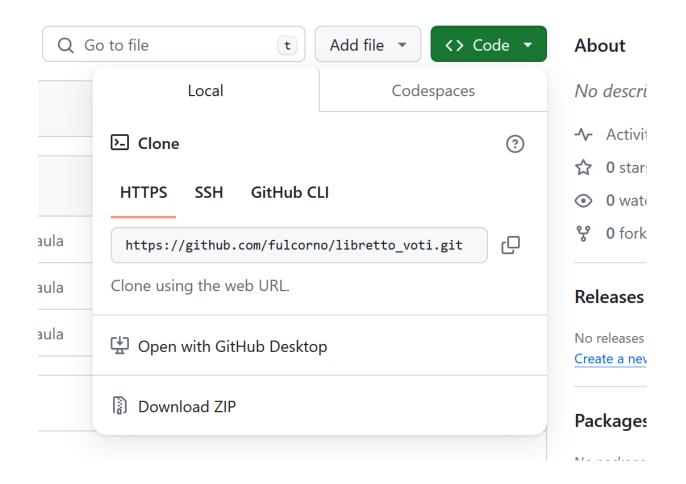

Workflow 2: "Work on a project"

- 1. "Fork" the project in GitHub (you make a copy in your repository)
- 2. Clone your project in PyCharm
- 3. Work on the project
- 4. Commit and Push the changes

Forking the project

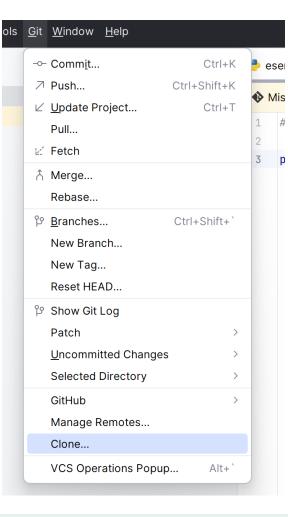

≡ () TdP-2024 / li	TdP-2024 / libretto_voti				Q Type [] to search		>_ + • 💿 🕅 🖻 🔹

Copy the new project URL

Clone the project

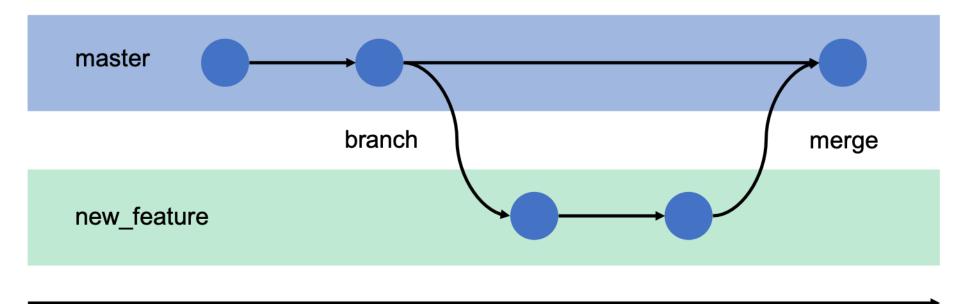

MORE ADVANCED GIT

Branches

time

Branches... in brief

- used to develop features isolated from each other
- the *main (or master)* branch is the "default" branch when you create a repository
 - you should use other branches for development and merge them back to the master branch upon completion
- Branches can be local (your local repo) or may be pushed to GitHub
